BEYOND LOGIX

AI SDR Blueprint v4.0

Migration Plan, Platform Comparison &
Next-Generation Architecture

February 2026

Prepared for Quinn | Beyond Logix

CONFIDENTIAL

1. Executive Summary

Your v3 AISDR Blueprint launched in November 2025 was architecturally sound for its time. It solved the right problem: multi-source data triangulation for importer identification in the logistics vertical. However, the AI SDR landscape has fundamentally shifted in three months. What required 15+ custom bots, scrapers, and API connections can now be achieved with 2–3 platforms.

This document provides a complete migration plan to move Beyond Logix from a fragile, API-dependent bot architecture to a modern, platform-native AI SDR system that is easier to maintain, less expensive to operate, and significantly more autonomous.

> **Bottom Line**
> *Your current system is a data plumbing project. The goal is to transform it into an autonomous sales agent that finds, qualifies, engages, and books meetings with logistics prospects while you focus on closing.*

What Changes

Dimension	v3 (Current)	v4 (Proposed)
Custom Bots/Scrapers	8+ (Flexport, Freightos, FMCSA, Google Business, FBA, Domain, etc.)	0 — replaced by Clay + Claygent workflows
Enrichment Tools	DomainBot + Multi-Source Validator + Seamless + Apollo	Clay waterfall enrichment (150+ providers)
Intent Layer	Bombora + Seamless + 3 signal bots	Bombora (or 6sense) + Clay signals
Sequencing	Apollo SequenceBot (rule-based)	Agentic AI SDR (autonomous)
AI Scoring	Custom-built models	Clay AI columns + Claygent research
Maintenance Burden	High — every bot is a failure point	Low — platform-managed
Est. Monthly Cost	$3,000–$5,000+ (tools + dev time)	$1,600–$2,700 (Clay + AI SDR)

2. Component-by-Component Audit

Every component in your v3 Blueprint falls into one of three categories: Keep (competitive moat), Replace (platform-native alternative exists), or Sunset (no longer needed).

2.1 KEEP — Your Competitive Moat

Trade Data Sources (ImportKey, ImportGenius, Panjiva)

These are your differentiator. No general-purpose AI SDR platform replaces niche customs/import data. Keep all three, but change how they connect: upload their output into Clay as your central enrichment hub rather than running separate pipelines per source.

HubSpot CRM

Your CRM is the system of record. Keep it and ensure whatever AI SDR platform you choose has native bi-directional HubSpot sync.

Bombora (Intent Data)

Enterprise-grade intent data for freight, customs, and logistics SaaS topics. Keep as a standalone signal feed. Consider upgrading to 6sense during Tier 2 if you need account-level intent scoring.

2.2 REPLACE — Platform-Native Alternatives

v3 Component	v4 Replacement	Why
DomainBot + Multi-Source Validator	Clay waterfall enrichment	Checks 150+ providers sequentially; higher match rates than any single validator
Flexport Scraper	Claygent research workflow	Claygent navigates websites like a human, no custom scraper maintenance
Freightos Marketplace Scraper	Claygent research workflow	Same — Claygent can extract marketplace data without code
Amazon FBA Importer Bot	Claygent + import data cross-reference	FBA importers show up in trade data; Claygent verifies and enriches
Google Business Cargo-Shipper Bot	Clay Google Maps sourcing + Claygent classification	Clay has native Google Maps business discovery built in
DOT/FMCSA Freight Bot	Claygent scraping FMCSA public records	Claygent can navigate public databases and extract data at scale
Hiring Signal Bot	Clay job change / hiring signals	Clay natively monitors hiring events and job changes across platforms
Product Launch Bot	Clay custom signals + Claygent	New product/SKU launches detectable via company news monitoring

v3 Component	v4 Replacement	Why
Supply Chain Shift Bot	Bombora intent + Claygent research	Combine intent spikes with Claygent research on supplier changes
AI Industry Classifier	Clay AI scoring column	Use plain-English prompts to classify companies; no model to maintain
AI Likelihood to Import Score	Clay AI scoring column	Feed enriched data into AI prompt for import probability scoring
Apollo SequenceBot	Agentic AI SDR (see Section 3)	Autonomous engagement replaces static sequences
Seamless + Apollo (enrichment)	Clay (accesses Apollo, Seamless, and 100+ others)	Single platform, better coverage, lower total cost

2.3 SUNSET — No Longer Needed

- Basic single-factor scoring (already removed in v3, confirmed deprecated)
- Standalone Seamless Buyer Intent (redundant with Bombora + Clay signals)
- Any custom API middleware connecting the above bots (eliminated by platform consolidation)

3. Agentic AI SDR Platform Comparison

The agentic AI SDR market has exploded since late 2025. Below is an honest, research-backed comparison of the four platforms most relevant to Beyond Logix, evaluated against your specific needs: niche logistics vertical, HubSpot CRM, small team, and budget consciousness.

3.1 Comparison Matrix

Criteria	AiSDR	Artisan (Ava)	11x (Alice)	Salesforge (Frank)
Est. Monthly Cost	$900–$2,500	$2,000–$6,000	$4,000–$5,000	$500/quarter
Contract Terms	Quarterly, cancel anytime	Annual, auto-renew	Annual, lock-in	Quarterly
HubSpot Integration	Native, deep bi-directional	Yes, standard	Yes, standard	Limited
Channels	Email, LinkedIn, SMS	Email, LinkedIn	Email, LinkedIn, Phone	Email, LinkedIn
Personalization	Strong — LinkedIn signals, company news, custom personas	Good — 300M+ contact DB, trainable skills	Mixed reviews — struggles with niche verticals	Good — learns from engagement data
Reply Handling	Autonomous — responds within 10 min, handles objections	Semi-auto — human review option	Classifies replies, basic objection handling	Auto follow-ups, basic replies
Niche Suitability	Good for niche verticals with clear ICP	Less suited for niche/specialized markets	Best for broad markets with proven playbook	Good for cold email volume
Lead DB Included	700M+ contacts	300M+ contacts	Yes (size undisclosed)	Yes, built-in
Transparency	Pricing published online	Contact sales required	Contact sales required	Pricing published
User Sentiment	Positive; praised for HubSpot integration, results within days	Mixed; good UX, but stability issues reported	Polarized; good for volume, generic for niche	Positive; budget-friendly, good for email-first

3.2 Recommendation for Beyond Logix

> **Primary Recommendation: AiSDR**
> *Best fit for a niche logistics vertical with HubSpot CRM, need for autonomous reply handling, transparent pricing, and flexible quarterly contracts. Start at $900/month and scale as results prove out.*

Here is why AiSDR is the strongest fit for Beyond Logix specifically:

- **HubSpot-Native:** AiSDR offers the deepest HubSpot integration of any AI SDR on the market. It syncs lists, enriches missing data in HubSpot records, scores leads, and logs all activity bi-directionally. No middleware needed.
- **Niche Vertical Fit:** AiSDR allows custom AI personas trained on your specific sales motion. For logistics, this means you can teach it freight terminology, customs pain points, and supply chain language that generic platforms miss.
- **Autonomous Reply Handling:** When a prospect responds, AiSDR handles the conversation autonomously, answering questions, managing objections, and escalating to you only for complex situations. This is where static sequences fail.
- **Flexible Contracts:** Quarterly billing with cancel-anytime terms. 11x and Artisan lock you into annual commitments. For a growing company testing a new system, flexibility matters.
- **Transparent Pricing:** Published pricing on their website. No black-box quotes. Start at $900/month for 3,600 messages.

Why Not the Others?

- **11x (Alice):** At ~$50K–$60K/year with annual lock-in, it is over-engineered and overpriced for a small logistics team. Multiple user reviews report generic messaging that does not work for specialized verticals. Cancellation is difficult.
- **Artisan (Ava):** Reviewers consistently note it is less suited for specialized or niche markets. The ~$24K annual minimum is steep, and platform stability issues are well-documented. The 2–3 month ramp time is too long for your needs.
- **Salesforge (Agent Frank):** Strong budget option at ~$500/quarter, but limited HubSpot integration and best suited as an email-only tool. If you need just cold email volume as a secondary channel, it can be a useful supplement later.

4. The v4 Architecture

The new system consists of three layers, down from seven in v3. Each layer is a commercial platform, not a custom bot.

Layer 1: Data Foundation (Clay)

Clay becomes your single data hub, replacing 10+ separate tools and bots.

What Clay Does for Beyond Logix

1. Imports your trade data (ImportKey, ImportGenius, Panjiva) as CSV uploads into Clay tables
2. Enriches each company with 150+ data providers: firmographics, technographics, contact info, social profiles
3. Uses Claygent (AI research agent) to scrape FMCSA records, competitor platforms, and company websites — no custom bots
4. Runs AI scoring columns that classify each lead (importer vs. shipper vs. 3PL vs. forwarder) using plain-English prompts
5. Monitors hiring signals, job changes, company news, and funding events as real-time triggers
6. Validates emails and phone numbers through waterfall enrichment (checks multiple providers sequentially)
7. Pushes enriched, scored, qualified leads to AiSDR for autonomous outreach

Recommended Plan

Clay Explorer ($349/month): 10,000 credits/month, HTTP API integration, webhooks, email sequencing integrations. Upgrade to Pro ($720/month) when you need native HubSpot CRM sync from Clay directly.

Layer 2: Intent Intelligence (Bombora)

Keep Bombora as your enterprise intent data provider. It captures real-time research behavior for freight, customs, and logistics topics. Feed Bombora intent scores into Clay as an enrichment column, where they combine with other signals to create a composite lead score.

In Tier 2 (0–3 months), evaluate 6sense as an upgrade for account-level intent scoring and predictive analytics.

Layer 3: Autonomous Outreach (AiSDR)

AiSDR replaces Apollo SequenceBot and the HubSpot Gatekeeper as your execution layer.

What AiSDR Does for Beyond Logix

8. Receives qualified, enriched leads from Clay via HubSpot sync
9. Generates hyper-personalized outreach across email, LinkedIn, and SMS using AI personas trained on your logistics sales motion
10. Monitors prospect LinkedIn activity and company news for real-time personalization

11. Handles replies autonomously: answers questions, manages objections, and books meetings
12. Routes complex conversations to your team with full context
13. Logs all activity back to HubSpot bi-directionally
14. Provides analytics on open rates, response rates, and conversion metrics

Recommended Plan

AiSDR Grow ($900/month): 3,600 messages/month, unlimited seats, unlimited campaigns, native HubSpot integration, 24/7 support. Scale to $2,500/month (12,000 messages) as pipeline grows.

5. Budget Comparison

Monthly Cost: v3 vs v4

Item	v3 Est. Monthly	v4 Est. Monthly
Trade Data (ImportKey + ImportGenius + Panjiva)	$500–$1,500	$500–$1,500 (kept)
Enrichment (Seamless + Apollo + DomainBot)	$400–$800	$0 (replaced by Clay)
Clay (Explorer Plan)	$0	$349
Intent Data (Bombora)	$500–$1,000	$500–$1,000 (kept)
AI SDR (AiSDR Grow)	$0	$900
Sequencing (Apollo Sequences)	$100–$300	$0 (replaced by AiSDR)
Custom Bot Dev / Maintenance	$500–$1,500	$0
HubSpot CRM	Existing	Existing
ESTIMATED TOTAL	**$2,000–$5,100**	**$2,249–$3,749**

Net Impact

You consolidate from 15+ tools and bots down to 3 core platforms, reduce monthly costs by up to 35%, and eliminate custom bot maintenance entirely. The savings in developer time alone likely exceeds the AiSDR subscription cost.

6. Migration Plan

This is a phased rollout designed to be low-risk. You run new and old systems in parallel during Phase 1–2, then sunset legacy tools only after confirming coverage.

Phase 1: Foundation (Weeks 1–3)

Goal: Get Clay running and replicate your enrichment/scraping workflows

- **Week 1:** Sign up for Clay Explorer plan. Set up workspace. Import a sample batch of 200–500 companies from your trade data sources (ImportKey/ImportGenius) as a CSV.
- **Week 1:** Build your first Claygent workflow: take a list of company domains and have Claygent research each one to determine if they are an importer, domestic shipper, 3PL, or forwarder. This replaces your AI Industry Classifier.
- **Week 2:** Set up Clay waterfall enrichment for email verification, phone numbers, and firmographic data. Benchmark against your current DomainBot + Multi-Source Validator output. Expect 80%+ coverage.
- **Week 2:** Build a Claygent workflow to scrape FMCSA public records for carrier/shipper data. Test against your DOT/FMCSA Freight Bot output.
- **Week 3:** Create AI scoring columns in Clay: “Likelihood to Import” score and “Industry Classification” using plain-English prompts against the enriched data. Compare output to your existing AI scoring models.
- **Week 3:** Integrate Bombora intent data as a Clay enrichment column. Map intent topics to your ICP.

> **Phase 1 Success Criteria**
> *Clay produces enriched, scored, classified leads at equal or better quality than your current bot-based pipeline for the test batch of 500 companies.*

Phase 2: Outreach (Weeks 3–6)

Goal: Deploy AiSDR alongside Apollo SequenceBot and compare

- **Week 3:** Sign up for AiSDR Grow plan. Connect to HubSpot. Set up your first AI persona trained on Beyond Logix’s logistics sales motion: value props, pain points, objection handling, tone of voice.
- **Week 4:** Push a batch of 100 Clay-enriched leads to AiSDR via HubSpot sync. Launch your first campaign targeting importers identified through trade data.
- **Week 4–5:** Run AiSDR and Apollo SequenceBot in parallel on separate, equal-sized lead lists. Track open rates, reply rates, meeting bookings, and lead quality.
- **Week 6:** Evaluate results. Based on industry benchmarks, expect AiSDR to outperform static sequences on reply handling and meeting conversion due to autonomous response management.

> **Phase 2 Success Criteria**
> *AiSDR matches or exceeds Apollo SequenceBot on meetings booked per 100 leads sent, with lower manual effort required for reply management.*

Phase 3: Consolidation (Weeks 6–10)

Goal: Sunset legacy bots and fully migrate to v4 architecture

- **Week 6–7:** Sunset custom scrapers one by one as you confirm Clay + Claygent covers the same ground. Start with lowest-risk bots (Google Business Cargo-Shipper, Product Launch Bot).
- **Week 7–8:** Decommission DomainBot, Multi-Source Validator, and Hiring Signal Bot. Verify Clay waterfall enrichment and signal monitoring are producing equivalent or better data.
- **Week 8–9:** Decommission Flexport Scraper, Freightos Scraper, and Amazon FBA Importer Bot. These are the highest-maintenance bots; replacing them with Claygent workflows saves the most developer time.
- **Week 9–10:** Migrate remaining Apollo sequencing to AiSDR. Cancel Seamless enrichment subscription (covered by Clay). Review and optimize AiSDR personas based on 6 weeks of engagement data.

> **Phase 3 Success Criteria**
> *All custom bots decommissioned. Full pipeline running through Clay → HubSpot → AiSDR. Monthly tool cost reduced. Zero custom scraper maintenance required.*

Phase 4: Advanced (Months 3–6)

Goal: Add Tier 2 and Tier 3 capabilities from original blueprint

- **Month 3–4:** Evaluate 6sense or Demandbase to replace Bombora if deeper account-level intent is needed. This maps to your original Tier 2 “Additional Data & Intent” plan.
- **Month 3–4:** Build Clay AI scoring columns for Duty Drawback/Tariff Engineering Score and SaaS Forwarder Fit Score (Tier 2 “Advanced AI Scoring”). These are now simple Clay columns, not custom models.
- **Month 4–6:** Explore Clay + AiSDR integration with supply chain disruption signals (Project44, FourKites) for Tier 3 predictive outreach timing. This maps to your original Tier 3 vision.
- **Month 6+:** Scale AiSDR to higher message volume. Add Agent Frank (Salesforge) as a secondary cold email engine if volume demands exceed AiSDR capacity. Evaluate adding voice/phone channel via 11x Julian or Orum if phone outreach proves valuable.

7. Risks & Mitigations

Risk	Impact	Mitigation
Clay credit burn	Complex enrichment workflows can consume credits faster than expected	Start on Explorer, track credits weekly, use your own API keys for high-volume enrichments to reduce Clay credit usage by 70–80%
AiSDR messaging quality	AI-generated logistics messaging may lack domain nuance initially	Invest 2–3 weeks in persona training before scaling. Use human-in-the-loop review for first 50 messages. Iterate on prompts based on reply analysis
Parallel costs during migration	Running old and new systems simultaneously increases cost temporarily	Budget for 4–6 weeks of overlap. Sunset legacy tools on confirmed replacement schedule. Phase 1–2 costs are incremental (~$1,250/month)
Claygent scraping limitations	Some sites may block Claygent or return incomplete data	Test each critical scraping workflow in Phase 1. For any gaps, retain that specific custom bot until Claygent coverage improves
HubSpot data quality	Garbage in, garbage out — poor CRM data degrades AI performance	Use Clay as a CRM enrichment pass before launching outreach. Clean HubSpot data as part of Phase 1 setup

8. Immediate Next Steps

#	Action	Owner	Timeline
1	Sign up for Clay free trial (14-day Pro trial, no credit card)	Minh	This week
2	Export 500-company test batch from ImportKey/ImportGenius	Minh	This week
3	Upload test batch to Clay, build first enrichment + classification workflow	Minh	Week 1
4	Book AiSDR demo to evaluate persona setup and HubSpot integration	Minh	Week 1
5	Benchmark Clay enrichment output vs. current DomainBot + validator pipeline	Minh	Week 2
6	Sign up for AiSDR if Clay benchmark is positive; begin persona training	Minh	Week 3
7	Launch first parallel test: AiSDR vs. Apollo on 100 leads each	Minh	Week 4
8	Review results; begin Phase 3 sunset of legacy bots	Minh	Week 6
